

Living well with dementia: Your views on the value of smart technology

Participants needed for a research project

**Do you have experience of living with dementia or supporting someone with dementia?
Would you like to share your views or experiences of using SMART technology?**

LifeTec and the University of Queensland invite you to participate in a study investigating how smart technologies can support people to live well with dementia at home and in the community.

Smart technologies can include smart home devices, mobile phones and tablets, apps or devices which people use to make homes safer, stay socially connected, or manage health and wellness.

We would like to know more about whether smart technologies can offer benefits to people living with dementia. You do not need to be using these technologies at present.

Your participation will involve a 40 minute in person or by phone at a time convenient to you.

There are further research activities which may be of interest to you following your interview. These include focus groups, video stories and technology trials.

This study is open to people with dementia and their care partners, who are living in the community. Service providers who offer community based support to people with dementia are also eligible to take part in the study.

**To express your interest or to ask any questions, please contact Zoe du Cann at LifeTec:
